29 January 2003, claim 1, paragraphs 0003, 0004, 0008, all drawings

Claim 1

The invention described in claim 1 does not appear to possess novelty on account of document 1 cited in the ISR. Means in document 1 for gradually reducing the transmittance rate of a wavelength region sandwiched between a transmission band region at wavelength 400 nm and higher and 550 nm or lower and a nontransmission band region at wavelength 750 nm and higher and 1050 nm or lower and reducing it from the transmission band side toward the nontransmission band side corresponds to the steepness preventing means described in claim 1.

Claims 2-7

The inventions described in claims 2-7 are not disclosed in any of the documents cited in the ISR and appear to possess novelty. In particular, steepness preventing means that constitutes a filter from a plurality of layers, varies the optical film thickness of the first thin film (high refraction index film) and second thin film (low refraction index film) in each layer at each layer, makes the optical film thickness of the laminated first thin film (high refraction index film) and second thin film (low refraction index film) generally identical in at least one of these layers, and in the other layers sets the optical film thickness of the laminated first thin film and second thin film so that they gradually increase from the transparent base side is not disclosed in any of the documents.
